"A Device for Shaping Series-Coded Signals"

Moscow, Otkrytiya, izobreteniya, promyshlennyye obraztsy, tovarnyye znaki,
No 5, Feb 71, Author's Certificate No 293292, Division G, filed 21 Oct 68,
published 15 Jan 71, p 177

Translation: This Author's Certificate introduces a device for shaping series-coded signals of length N . The device contains shift registers and cadence pulse generators. As a distinguishing feature of the patent, the number of digital places in the shift register is reduced by connecting two shift registers in a matrix circuit, one of the registers consisting of n digital places, while the other consists of N/n places. The output of each of the digital places in the second register is connected to those inputs of digital places in the first register where the "ones" of the code to be generated must be recorded for a given group of symbols of length n . The first register operates on a cadence frequency of f , and the second on a frequency of f/n .

"Some Cytochemical Properties of Fusarium Species Under Different Cultivation Conditions"

Yerevan, Biologicheskii Zhurnal Armenii, Vol 24, No 10, 1971, pp 63-70

Abstract: The behavior of volutin granules in mycelium of *Fusarium oxysporum* and *F. javanicum* during submerged culturing was studied. Czapek medium and brewing wort were used for culturing these two strains of *Fusarium* in Erlenmeyer 250 ml. flasks at 24-26°C. Microscopic and cytochemical studies of mycelium was carried out every 24 hr. The development of *Fusarium* species on the above two media proceeded in six phases. A detailed description of each phase is given. These phases could not be definitely related to time, and phases of both strains were almost identical.

"Survey of Species and Forms of *Fusarium* Found in Armenia"

Yerevan, *Biologicheskii Zhurnal Armenii*, No 7, 1971, pp 101-104

Abstract: A total of 328 strains of *Fusarium* were isolated from sick plants and soil samples. Morphological, cultural, and physiological studies showed that they belonged to 59 species and variations. Of these, 29 were found in Armenia for the first time and 1 species and 10 species were new to science: *Fusarium martiellae* - *discolorioides* Batikian sp. novae; *Fusarium javanicum* Koord. var. *chrysanthemi* - *leucanthemi* Batikian var. novae var. *sclerotii* Batikian var. novae; *Fusarium solani* (Mart.) App. et Wr. var.; *Fusarium redolens* - *sclerotii* Batikian var. novae; *Fusarium oxysporum* Schlecht. emend. Syd. et Hans. var. *lilii* Batikian var. novae; *Fusarium gibbosum* var. *rhizosphaerae* Batikian var. novae; *Fusarium heterosporum* Nees var. *anastomosae* Batikian var. novae; *Fusarium lateritium* Nees var. *microconidii* Batikian var. novae; *Fusarium sambucinum* Fuck. var. *raphani* Batikian var. novae; *Fusarium semitectum* Berk. et Rav. var. *violaceae* Batikian var. novae; *Fusarium buxicola* Sacc. var. *Chlamydosporae* Batikian var. novae. The substrates were highly varied. Many of the species and variations were isolated from soil,

"An Experimental Study of the Pathogenicity and Specialization of Some Species and Forms of Fusarium Isolated in the Armenian SSR"

Yerevan, Biologicheskii Zhurnal Armenii, Vol 24, No 4, Apr 71, pp 60-68

Abstract: Fungi of the genus Fusarium which cause wilt of plants (garden flowers and tomato plants) and produce rotting of harvested fruit and vegetables in the Armenian SSR were isolated and identified. Their pathogenicity and host specialization were tested in experiments in which plants, fruit, or vegetables of the species from which the fungi had been isolated were infected and the capacity of the fungi to infect plants, fruit, and vegetables of other species, genera, and families was determined. Infection of the original host species succeeded in every instance. The species of Fusarium that had been isolated also proved capable of infecting a rather wide range of plants, fruit, or vegetables of species, genera, and families other than those of the initial host.

"Reaction of Tertiary Arsenic Oxide of the Dihydrophenarsazine Series With
Acids"

Leningrad, Zhurnal Obshchey Khimii, Vol 41 (103), No 3, Mar 71, pp 564-567

Abstract: It was determined that the hydrochloric, hydrobromic and trichloroacetic acids as well as pentachlorophenol form adducts with 10-alkyl-(aryl)-5,10-dihydrophenarsazine oxides (I) in aqueous alcohol medium or in benzene. To a heated ethanol solution of (I) the above reagents were added in 10 ml water; the solution was heated for 15 min, the volume was concentrated to 1/2-1/5 and cooled. A colorless crystalline product was obtained -- the adduct mentioned above --, it was filtered, dried and recrystallized from ethanol. It was also shown that (I) could be titrated with HCl in a mixture of acetic acidacetic anhydride.

ABSTRACT/EXTRACT--(U) GP-0- ABSTRACT. THE LEVELS OF THE ENZYMES, ALANINE AND ASPARTIC AMINOTRANSFERASE (ALT AND AST) AND CHOLINESTERASE WERE INVESTIGATED IN THE SERUM OF PATIENTS TREATED WITH CYCLOPHOSPHANE (26 WITH LUNG TUMORS BEFORE SURGERY AND 10 AFTER RADICAL SURFERY). THE DRUG WAS GIVEN IN LARGER DOSES, 2 TO 5 G I.V. EVERY 10-14 DAYS. ALT AND AST WERE DETD. BY THE UMBRIGHT METHODS (MODIFIED); CHOLINESTERASE LEVEL WAS EVALUATED BY MEASUREMENT OF HOAC, AFTER ENZYMIC DECOMP. OF ACETYLCHOLINE DURING 1 MIN IN 1 ML SERUM. THE ENZYMES WERE MEASURED BEFORE THE BEGINNING OF TREATMENT, ON THE 2-3RD DAY, AND ON THE 10-12TH DAY. HEALTHY (15) PERSONS SERVED AS CONTROLS. IN CASES OF MALIGNANCY THE INITIAL VALUES WERE SOMEWHAT HIGHER THAN IN NORMALS. AFTER THE ADMINISTRATION OF CYCLOPHOSPHANE, A DISTINCT RISE OF ALT, A LESSER RISE OF AST, AND A FALL IN CHOLINESTERASE ACTIVITIES WERE OBSD. AFTER RADICAL SURGERY THE SHIFTS WERE LESS DISTINCT, NO RISE OF AST WAS OBSD. NO DEPENDANCE WAS FOUND BETWEEN THE ENZYMIC ACITIVITY AND THE STAGE OF THE DISEASE. THE OBSD. CHANGES MAY BE CONSIDERED AS SIGNS OF METABOLIC DISTURBANCES IN THE LIVER. FACILITY: LAB. BIOCHEM., P. A. GERTSEN RES. INST. ONCOL., MOSCOW, USSR.

ABSTRACT/EXTRACT--(U) GP-0- ABSTRACT. DATA OF THE FUNCTIONAL STATE OF THE LIVER (BIOCHEMICAL AND THE RESULTS OF RADIOISOTOPE HEPATOGRAPHY WITH RADIOIODINE BENGAL ROSE) WERE STUDIED IN 30 PATIENTS WITH LUNG CANCER WHO WERE TREATED WITH LARGE SINGLE DOSES OF CYCLOPHOSPHAN. THE TEST WITH RADIOIODINE LABELLED BENGAL ROSE ENABLED TO DETECT CHANGES IN THE ABSORPTIVE EXCRETORY FUNCTION OF THE LIVER BEFORE TREATMENT. RADIOISOTOPE HEPATOGRAPHY POINTED TO THE ESSENTIAL TOXIC EFFECT OF CYCLOPHOSPHAN ON THE LIVER. THIS EFFECT DIRECTLY DEPENDED ON THE VALUE OF THE COURSE DOSE OF THE PREPARATION AND UPON THE CLINICAL RESULTS OF TREATMENT. THE DISTURBED INDICES OF THE ABSORPTIVE EXCRETORY FUNCTION OF THE LIVER PRACTICALLY REVERT TO NORMAL 2-3 WEEKS AFTER THE END OF CHEMOTHERAPY. THE TEST WITH RADIOIODINE LABELLED BENGAL ROSE IS A MORE SENSITIVE TEST FOR DETERMINING THE FUNCTIONAL STATE OF THE LIVER IN THE TREATMENT OF LUNG CANCER PATIENTS WITH LARGE SINGLE DOSES OF CYCLOPHOSPHAN THAN THE ROUTINE LABORATORY TECHNIQUES. THIS GIVEN GROUNDS TO RECOMMEND THIS TEST FOR THE ASSESSMENT OF RESERVES OF COMPENSATORY POSSIBILITIES OF THE LIVER. FACILITY: LABORATORIYA IZOTOPNYKH ISSLEDOVANIY, OTD. "Local Theorem for Limiting Poisson Distribution"

Nauch. zap. Tashkent. in-t nar. kh-va (Scientific Notes of Tashkent Institute of National Economy), 1970, vyp. 34, pp 137-141 (from RZh-Kibernetika, No 11, Nov 71, Abstract No 11V50)

Translation: The authors consider a sequence of series of random quantities $\xi_{n1}, \xi_{n2}, \dots, \xi_{nk_n}$, which are uniformly distributed in each series and take on integral non-negative values. It is assumed that $S_n = \xi_{n1} + \dots + \xi_{nk_n}$. The following theorem is proved. In order that

$$P(S_n = m) \sim \frac{\lambda^{m_1} e^{-\lambda}}{m!},$$

it is necessary and sufficient that the following two conditions be satisfied: 1) the distribution function of the sum $S_n - MS_n + \lambda$ converges to a Poisson distribution function with parameter λ ; 2) the GCD for those differences $m_1 - m_2$, for which $P(\xi_{n1} = m_1) > 0$, $P(\xi_{n1} = m_2) > 0$ is unity. "Comparative Characteristics of Nucleotide Blocks of DNA After Radiation Injury
and in Leukemia"

Moscow, Doklady Akademii Nauk SSSR, No 1, 1972, pp 233-236

Abstract: DNA was isolated from bone marrow of Wistar rats irradiated at 500 r and from spleens of C57Bl₆ mice 6 days after induction of La leukemia. Determination of the pyrimidine nucleotide blocks of the DNA by paper chromatography revealed good separation of most of the spots, 7 and 8 in particular. The changes in distribution of the pyrimidine nucleotide blocks were found to be the same in both DNA's. There was a significant increase in the relative content of spot 10 material compared with the total content of the material of all the spots as well as a maximum decrease in the nucleotide blocks corresponding to chromatographic spot 7. The destruction of these portions of DNA resulted in an increase in the amount of material corresponding to spots 8 and 10. The similarity of the changes in nucleic acids produced by irradiation and leukemia may account for the increased frequency of tumors and especially leukemias after exposure to ionizing radiation.

"SAPPOR -- a System for Automating the Process of Making Optimum Decisions"

Moscow, Kibernetich. sistemy avtomatiz. proyektir.--sbornik (Cybernetic
Automated Design Systems--collection of works), 1973, pp 29-35 (from RZh-
-Kibernetika, No 7, Jul 73, abstract No 7V633 by A. Doroshenko)

Translation: SAPPOR is a dialog system oriented for making optimum de-
cisions in the process of designing technical devices. The system is
realized on the BESM-3M computer with two memory arrays, the second
being designed for operation of a screen panel. The software of the
system is based on the modular principle and has the following modules:
1) "Model" -- for constructing the mathematical model of the object
being designed. This block is replaceable and varies depending on the
class of the object of optimization. In developing the SAPPOR, RLC cir-
cuits were taken as models. 2) "Formulation of the Problem" -- a com-
piler which prepares classes of problems formulated by the designer for

1/2

USSR

AL'PEROVICH, E. Ye. et al., Kibernetich. sistemy avtomatiz. proyektir., 1973, pp 29-35

solution (calculating the characteristics of the object, optimizing the mathematical expectation in satisfying probability limitations, etc.). 3) "Method of Solution" -- a set of programs for finding the global minimum of an arbitrary curve, minimizing multiparameter functions and numerically solving problems in nonlinear programming. 4) "Check" -- enables following and controlling the process of finding the optimum with respect to information which may appear at the output (alphanumeric printer, screen panel) as ordered by the operator. 5) "Output of Results" -- gives the results of optimization in the form of graphs and tables on a screen panel or on paper with the use of an alphanumeric printer or a "Konsul" typewriter. The last four modules are universal and do not depend on the type of optimization object. An advantage of the SAPPOR is the possibility for operative search for the optimum decision and the combination of the designer's experience and intuition with rigorous mathematical methods. In this connection, the design process can be carried out without knowledge of computer programming and the corresponding methods of search optimization.

"Optimum Design of Electronic Circuits"

Gor'kiy, Izvestiya VUZov: Radiofizika, Vol 15, No 7, 1972, pp 1016-1025

Abstract: The paper deals with the process of computer design of optimum electronic circuits. Design is understood to comprise the following basic stages: 1. formalization of the design goal; 2. selecting the optimum circuit schematic (configuration); 3. working out mathematical models and analyzing circuit characteristics; 4. determining the optimum values of circuit elements; 5. elaborating the topology of the circuit. The optimization problems which arise in each of these stages can be formulated as linear programming problems

$$\min_{x \in D} Q(x_1, \dots, x_n),$$

where

$$D = \{x \mid \varphi_j(x_1, \dots, x_n) \leq 0, \quad j = 1, \dots, m\}.$$

1/2

"General Problems in Guidance Theory"

Moscow, Upr. dvizhushchimisya ob'yektami. Tr. IV Vses. soveshch. po avtomat. upr. Tbilisi, 1968--sbornik (Control of Moving Objects. Works of the Fourth All-Union Conference on Automatic Control. Tbilisi, 1968--collection of papers), 1972, pp 8-29 (from RZh-Raketostroyeniye, No 10, Oct 72, abstract No 10.41,157)

Translation: A united approach to design of spacecraft control systems is proposed. Formulation of the general problem of guidance is discussed. A linear guidance system is used to illustrate the general features and specific characteristics of systems of remote control, self-guidance and autonomous guidance. The problem of optimizing the guidance system is considered, and an analysis is made of the specifics of solutions for cases of different sources of information with account for different types of energy limitations. An investigation is made of the influence of reaction on the characteristics of the guidance system. Methods are outlined for analyzing a guidance system with regard to absence of complete information on vehicle characteristics. Four illustrations, bibliography of two titles. Résumé.

WAYS OF IMPROVING THE SYSTEM OF PURIFICATION AND STERILIZATION OF THE AIR IN THE MANUFACTURE OF ANTIBIOTICS.

Dr. L.K. Batova, S. Belichik

National Institute of Antibiotics, Moscow, USSR.

G10-12

There has been determined a special method to estimate the efficiency of the collection of the particles by filter materials. For this purpose special stands were constructed. Various methods of establishment the efficiency of the collection of the particles have been tested. During these experiments were taken the particles with diameters from 0,3 till 1,5 microns. Among the results of the values of efficiency of the filter materials the definite correction has been achieved. The simplified theoretical method has suggested for the estimation of the efficiency of various filter materials. This method allows to determine the level of filter materials as well as the downfall of the pressure of the air. For the production of antibiotics special method was worked out to determine the thermodynamic factors, the state of the air such as temperature, pressure and so on. The necessity to determine the parameters of the air in different climate conditions was shown in this work as well. The experiments were made to determine the properties of various types of filter materials, such as natural, synthetic and other materials. As a result of the experiment the most effective materials of a thin cleaning of the air were selected. Following this theoretical method the parameters of the filtration of the air were determined by means of the selected materials. The practical tests have shown a great efficiency in the collection of pollution particles by filter materials. The term of their service is rather long. On the base of the developed work the stability of exploitation of this plant for sterilization of the air depending on the used thermodynamic conditions and filter equipment has been successfully achieved.

DISTRIBUTION OF PRODUCERS OF ALKALOIDS AMONG THE FUNGI.

A.M. Bezborodov, I.I. Guseva, O.V. Krut'kaya, N.Ye. Bechmakhanova.

Institute of Biochemistry and Physiology of Microorganisms,
Academy of Sciences USSR, Puschino.

An ability of different representatives of fungi to synthesize alkaloids under the submerged and surface culturing was studied. Two kinds of media were used for the growth of fungi: (a) synthetic medium, containing mannite and succinic acid as the carbon source; (b) complex one with corn-steep extract, peptone and glucose.

Medium and mycelium were subjected to an analysis for alkaloid content. Mycelium was homogenized. Then alkalinescence and extraction by the chloroform-isobutanol mixture (4:1) were carried out. After that alkaloids were transferred into an aqueous solution by acidification with sulphuric acid. The procedure was repeated twice. Further analysis was carried out.

Qualitative alkaloid content tests were put with 6 reagents typical of alkaloids and close related to them compounds. As the result it was stated that 27 strains of 133 ones examined belonging to *Penicillium*, *Aspergillus*, *Fusarium*, gave all the 6 reactions, 1 gave 5 positive reactions and 29 did 3.

Most of extract didn't give colorimetric reaction typical of indole derivatives. Chemical nature of compounds obtained is under investigation.

"The Radiation Significance of Internal Irradiation Caused by Uranium of Plutonium Fission"

Moscow, Gigiyena i Sanitariya, No 5, 1970, pp 112-113

Abstract: The possibility of transferring research workers, handling uranium or plutonium isotopes to operations entailing exposure to neutron fields was examined. The issue is the additional internal irradiation created by fragments formed during the fission of the uranium or plutonium isotopes. Calculations show that from the standpoint of radiation safety, no additional restrictions need be placed on such personnel if the exposure to neutron radiation is at the maximum permissible level. If the neutron flux reaches values above this level, the conditions of radiation safety will be determined by the injurious effect of the neutron flux itself, the internal dose of alpha irradiation, and, if the neutron fields are sufficiently large, by the dose of fission fragments.

"Chemical Lasers Whose Operation Is Based on Chain and Branched Chain Reactions"

Moscow, Kinetika i Kataliz, Vol 11, No 2, Mar-Apr 70, pp 277-289

Abstract: Work on chemical lasers by the authors and others is reviewed. In work carried on by the authors and other members of their group, the theoretical aspects of a laser operating on the basis of the reaction $H_2 + F_2$ were subjected to study and experimental data obtained on the characteristics of a laser of this type. The reaction $H_2 + F_2$, being a branched chain reaction, could be expected to convert chemical energy into energy of stimulated emission more effectively than reactions of other types. The efficiency of conversion of chemical energy in an $H_2 + F_2$ laser proved to be 0.2-2%. Contribution of chain branching to generation became significant after the second limit of ignition had been reached i.e., a point had been passed beyond which energy branching began, but generation at a lower level of conversion of chemical energy was already observed in the region of a straight-chain reaction after passage of the first ignition limit. Violent $H_2 + F_2$ combustion in a laser of this type can be eliminated by regulating the composition of the gas mixture - specifically, by adding O_2 , which acts as an

1/2

- 94 -

USSR

TAL'ROZE, V.L., et al, Kinetika i Kataliz, Vol 11, No 2, Mar-Apr 70, pp 277-289

inhibitor. From the standpoint of application in the production of a laser effect, a reaction with continuous branching ought to be of advantage in comparison with a reaction such as $H_2 + F_2$ that branches only rarely. The only reaction with continuous branching which has been studied in detail is that of H_2 with O_2 , but the elementary act of branching in this reaction requires a high activation energy.

ABSTRACT/EXTRACT--(U) GP-0- ABSTRACT. FIRST RESULTS OF INVESTIGATIONS INTO RETINAL HEMODYNAMICS IN GLAUCOMA SIMPLEX, MADE BY USING FLUORESCENT ANGIOGRAPHY, ARE REPORTED. EXAMINATIONS COVERED 31 PATIENTS MOST OF WHOM WERE IN A FAR ADVANCED STAGE OF THE DISEASE. IN THE MAJORITY OF CASES THE RETINAL ARTERIES WERE FILLED IN GOOD TIME, BUT IN 6 PATIENTS THE ACCESS OF THE CONTRAST MEDIUM WAS DELAYED, ON THE AVERAGE BY 19 SECONDS. VENOUS CONGESTION, WHOSE INTENSITY DEPENDED NEITHER ON THE INCREASED ARTERIAL CIRCULATION TIME, NOR ON THE INTRAOCULAR TENSION WAS ELICITED IN NEARLY ALL PATIENTS (27); THE LENGTHENED ARTERIAL PHASE HAVING BEEN NOTED IN 9 PERSONS ONLY. THE MAXIMUM DURATION OF THE VENOUS PHASE WAS DEMONSTRABLE IN A GROUP OF PATIENTS WITH NORMAL ARTERIAL PRESSURE, INCLUDING HYPERTONICS IN WHOM ARTERIAL PRESSURE AT THE TIME OF ANGIOGRAPHY LAY WITHIN NORMAL LIMITS. IN HYPERTONICS PRESENTING ELEVATED ARTERIAL PRESSURE FIGURES DURING EXAMINATION THE VENOUS PHASE WAS THE SHORTEST. SPECIAL PLACE IN THE ORIGINATION OF GLAUCOMATOUS ATROPHY AND IN THE EXCAVATION OF THE OPTIC NERVE DISK IS ASSIGNED TO AN UPSET BLOOD CIRCULATION IN THE ANTERIOR LENGTH OF THE OPTIC NERVE. THE AUTHORS PROVE THIS BY STUDYING THE INTENSITY OF THE OPTIC NERVE DISK FLUORESCENCE. IN 8 PATIENTS WITH A FAR ADVANCED AND WELL DEVELOPED FORM OF GLAUCOMA THE FLUORESCENCE OF THE DISK WAS FOUND TO BE NORMAL. HENCE, CHANGES IN THE BLOOD SUPPLY OF THE OPTIC NERVE PROCEEDED NOT ALWAYS PARALLEL WITH THE SEVERITY OF THE GLAUCOMATOUS PROCESS. IN 15 PATIENTS VISUAL FUNCTION CHANGES WERE FOLLOWED UP IN DYNAMICS.

"The Effects of Amidopyrine on the Functional State of the Cerebral Cortex"

Kiev, Vrachebnoye Delo, No 9, 1973, pp 113-115

Abstract: Studies conducted on pentobarbital sodium-anesthetized cats in which amidopyrine was administered intravenously or applied directly to different cortical regions indicated that the stimulant activity that this drug exhibits for the CNS is due to its effects on the cutaneous, auditory, and visual representations on the cortex. The most susceptible region was cutaneous in which the evoked potential increased two-to three-fold. To an even greater extent the amplitude of the negative phase of the evoked potential was increased. These findings do not exclude possible effects of amidopyrine at the subcortical level, but indicate that the stimulating effects of this drug involves the reflex activity of the CNS.

"Basic Problems of Executing the A-COBOL Language"

V sb. Teoriya yazykov i metody postroyeniya sistem programmir (Language Theory and Methods of Constructing Programming Systems--collection of works), Kiev-Alushta, 1972, pp 150-161 (from RZh-Kibernetika, No 12, Dec 72, Abstract No 12V481)

Translation: The algorithms for the A-COBOL-ALMO translator created on the basis of the COBOL-ALMO translator is described. The memory allocation algorithms in the COBOL-ALMO translator is based on compiling special information tables about the data containing the information about their size, properties, location and hierarchy. The dimensions of the elementary data are defined by their standards; the dimensions of the group data are defined by the dimensions of their elementary components. In the algorithm for calculating the data dimensions, the stack memory system is used. When determining the location of the data, the accepted relative addressing principle is considered for which each recording is allotted a separate address file. As the beginning of the reckoning, the beginning of the write is taken, and as the reckoning unit, the bit. For data of a new type -- bit data in the A-COBOL execution -- a special system has been developed with the beginning of reading at the beginning of

1/3

USSR

BABENKO, L. P., et al., Teoriya yazykov i metody postroyeniya sistem programmir., Kiev-Alushta, 1972, pp 150-161

writing; the read unit is a bit. The bit (boolean) data are packed densely in the memory of the ALMO machine. When loading such data, special load files are formed which contain the allocation constants and the relative distances of each of the pieces of data from the beginning of write. These files are formed by the interpreting subprograms of the translator on the basis of the table of lengths of elements of the bit writes compiled when examining the data information tables considering the data hierarchy and their recurrence rate. The stack memory is also used here complicated by the algorithm for considering the recurrence of the bit data when compiling the element length table. For translation of the basic operators of A-COBOL combining the operations of corresponding COBOL operators and the address operations on the indexes, an algorithm was developed which forms the reference in the operating program to the corresponding subroutines of the interpreting system. For translation of the descriptions of the fields, an algorithm was developed which defines their parameters (the field dimension, the field index dimension, and so on) which are used when placing (selecting) an object in the field. The description of the syntax of the A-COBOL media supplementing the translator from COBOL to the translator from A-COBOL to the output language is presented. The description is presented in Bacus normal form supplemented by the indexes of the semantic

Kvantovyye Pribory (Quantum Devices), Leningrad, Energiya, 1972, 179 pp

Translation: Annotation: This book analyzes the general principles of oscillation amplification and generation by means of quantum systems, the physical processes in quantum devices of ultra-high and optical frequency ranges, the basic technical characteristics and special design features of these devices. The emphasis is on optical quantum devices, especially on those which are the most widely used in modern laser technology.

The book is intended for engineers and technicians involved in the development and operation of systems using quantum devices. It can also serve as a textbook for college students of corresponding specialties.

Table of Contents:

	Page
Introduction	3
Chapter 1. General principles of quantum device operation	
1.1 Stationary states of atoms and molecules	5
1.2 Balanced and unbalanced states of quantum system	11
1.3 Spontaneous and induced radiation	12
1.4 Interaction between electromagnetic field and matter	17

"Potential Applications of Exoelectron Emission for Refractory Studies"

Moscow, Ogneupory, No 5, 1972, pp 50-52

Abstract: This study concerns the exoelectron emission from the surface of Dinas brick for glass-making kilns. The experimental results are correlated with the wetting angles of contact with molten glass. Dinas refractories, while having the lowest wettability and a higher resistance to glass, appears to have a low emission capacity. Exoelectron emission is proposed as a method for reflecting the free surface energy of crystalline substances. The study included experimental impregnation of Dinas brick with solutions of orthophosphates, chromium salts, and other phosphates. The characteristics of the impregnated Dinas brick are cited in tabular form. (2 illustrations, 1 table, 5 bibliographic references)

"Effect of Mechanical and Thermal Treatments of Iron on the Efficiency of
Corrosion Inhibitors"

Moscow, Elektrokhimiya, Vol 7, No 7, Jul 71, pp 1012-1014

Abstract: The previously discovered dependence of adsorptive capacities of iron on the preliminary preparation of specimens (deformation, annealing) was investigated with a view to determine the effect of this factor on the efficiency of corrosion inhibitors. Experimental data show that the corrosion rate of iron in a pure acid solution is lower, but this dissolution rate in the presence of inhibitors is higher on specimens annealed at 750°C than on specimens annealed at 600°C. Corrosion tests of plates of Armco and zone melting iron annealed at 800°C and on specimens deformed by a 5% elongation revealed that the dissolution rate (in 1 N H₂SO₄) of annealed specimens was considerably lower than that of previously deformed specimens. The dissolution rate seems to be related to the growth of surface energy as a result of increased concentration of defects of the crystalline lattice. The corrosion behavior of individual single crystal faces of iron silicate (Si ≈ 3%) was also investigated and the results are analyzed. One illustr., two tables, six biblio. refs.

"Experience in the Remote Joining of the Boundaries of Land Holdings Through the Use of the RDG Radorangefinder"

Moscow, Geodeziya i kartografiya, No. 6, 1971, pp 22-28

Abstract: Experience in the remote joining of the boundaries of land holdings using the RDG radorangefinder by determining the geodesic coordinates of reliably fixed survey reference points located every 3-5 km is described. Formulas are given for determining the error in the mutual position of the survey points. Experience in the remote joining of the boundaries of land holdings in a forested region on the basis of polygonometric traverses laid with the RDG radorangefinder is described. The work was done in 1969 in the Lotoshinsk Region of Moscow Oblast in collaboration with the "Rosgiprozem" Planning Institute. The geodesic grid in the region was designed on topographical maps of the scale 1:50,000 with a cross section of the relief of the horizontals every 10 m. It was found that the accuracy of determining the survey reference points is quite sufficient for use as initial data in making theodolite traverses along the boundaries of land holdings. The relative error was 1:1500. It is noted that it is desirable to produce a small-scale radorangefinder that could measure distances of up to 5-8 km with an error of not more than 10 cm over all kinds of terrain conditions.

"Motion of an Earth Satellite Under the Effect of Perturbations From Tesseral Harmonics"

Byul. In-ta teor. astron. AN SSSR (Bulletin of the Institute of Theoretical Astronomy, Academy of Sciences of the USSR), 1972, 13, No 2, pp 73-91 (from RZh-Mekhanika, No 5, May 72, Abstract No 5A54)

Translation: The authors investigate analytical expressions for first-order perturbations in elements of the orbit of an artificial Earth satellite caused by tesseral harmonics in the expansion of the earth's gravitational potential in spherical functions with numbers $k, l \leq 4$. The coefficients of the trigonometric terms of these expressions are represented as finite polynomials in powers of the sines and cosines of the orbital inclination, and as segments of series in powers of the eccentricity accurate to e^4 . Resumé.

"The Motion of an Artificial Earth Satellite Under the Action of Disturbances From Tesseral Harmonics"

Byul. In-Ta Teor. Astron. AN SSSR (Bulletin of the Institute of Theoretical Astronomy, Academy of Sciences, USSR), Vol 13, No 2, 1972, pp 73-91 (from Referativnyy Zhurnal, Issledovaniye Kosmicheskogo Prostranstva, No 5, May 72, Abstract No 5.62.312, From Resume)

Translation: Tesseral harmonics of the potential of terrestrial gravity introduce a perceptible contribution to the disturbed motion of an artificial Earth satellite. It is therefore naturally of interest to develop methods for taking disturbances from these harmonics into account, as well as to derive formulas for these disturbances. There is the well-known work of B. Kaula (1961), in which was obtained a general formula for expanding the tesseral perturbation function into elements of the orbit, which is formally applicable for any eccentricities smaller than unity. The general formulas of Kaula are, however, rather bulky and their use is not always convenient when it is necessary to evaluate the disturbances from a small number of tesseral harmonics (with small values of k , l). In some works, analytic

USSR

BATRAKOV, Yu. V., and FILENKO, L. L., Byul. In-Ta Teor. Astron. AN SSSR, Vol 13, No 2, 1972, pp 73-91 (from Referativnyy Zhurnal, Issledovaniye Kosmicheskogo Prostranstva, No 5, May 72, Abstract No 5.62.312, From Resume)

expressions are presented for the disturbances of sputniks from tesseral harmonics; however, in these works the degree of accuracy in taking eccentricities into account is, as a rule, not very great. In the work of J. Kozai, for example, only the long-period terms are retained; this corresponds to the case of taking into account only terms containing eccentricity in the zeroth degree. G. A. Ustinov (1967) gives formulas for taking tesseral disturbances into account also with an accuracy to the zeroth degree of eccentricity. Formulas of such a type are very convenient for an approximate evaluation of the disturbances. In a number of cases, however, for example in the case of the motion of a sputnik in the resonance region, more exact accounting of the disturbances becomes necessary.

Explicit expressions are obtained for disturbances from tesseral harmonics with numbers $k, l \leq 4$ with higher accuracy with respect to eccentricity, namely all terms are taken into account to e^4 inclusively. The results are presented in the form of tables, and are convenient for calculations

"Phosphonic Derivatives of Adamantane"

Moscow, Doklady Akademii Nauk SSSR, Vol. 203, No. 3, 1972, pp 608-611

Abstract: The phosphonic derivatives of adamantane which have a carbon-phosphorus bond have only recently been described in the chemical literature. As is well known, one method of synthesizing organophosphorus compounds with such a bond is that of catalytic chlorophosphonation -- that is, the reaction of halogen derivatives of trivalent phosphorus (usually phosphorus trichloride) with various hydrocarbons in the presence of oxygen. The purpose of this study was to test this method in obtaining phosphonic adamantane derivatives. To an adamantane solution within excess of phosphorus trichloride was introduced dry oxygen, the temperature of the reaction mixture being held at 45 to -5°C for 26-30 hrs. This yielded adamantylphosphonic dichloride. The authors also produced the methyl ester of adamantylphosphonic acid by reacting the acid dichloride with sodium methylate in a toluene solution, with heating. Nine derivatives of a.-p. acid were synthesized (including four isomeric forms), for

"Compression of Plexiglass Cylinders by Glancing Detonation Waves"
Leningrad, Zhurnal tekhnicheskoy fiziki, No 5, 1973, pp 1059-1064

Abstract: This article pertains to the physical-chemical investigation of materials, subject to dynamic compression, which are kept in cylindrical containers under glancing detonation waves. Research of this type is now being intensively pursued. The purpose of this paper is to investigate the irregular reflection of shock waves in plexiglass cylinders under compression by glancing detonations, by a method suggested in an earlier article (G. A. Adadurov, et al, Fiz. gor. vzryva, vol 3, No 2, p 281, 1967). This method proposed using, as a model of the cylinder, plexiglass cylinders observed by high-speed photography to investigate the picture of the air flow through the fine, scintillating gaps between the plates composing the cylinders. A description is given of the explosive material used in the experiments and, briefly, of the experimental equipment. Results of the experiments are given in the form of curves of the change in velocity of the shock waves and

17. INTERACTION OF SHOCK WAVES WITH SOLIDS

Batsanov, S. S., Ye. V. Dulepov, E. M. Meroz, L. V. Lukina, and V. V. Romanov. Effect of explosions on materials. Shock compression of rare earth metal fluorides. PCIV, no. 2, 1971, 266-269.

Results of a study of shock compression of ten rare earth metal (REM) fluorides and yttrium fluoride are presented. It is shown that the greatest physical characteristic change occurs using 30-50 g hexogene charges, with the exception of CeF_3 and PrF_3 for which the most significant changes occur using 100-150 g charges. All the shock-compressed materials displayed optical anisotropy, since the initial materials were finely dispersed and therefore were pseudoisotropic. The new phase is normally inhomogeneous, and the properties change occurs (or accumulates) in different grains with varying intensity; the value of the effect is maximal only in a small number of crystalline particles. Table 1 shows refractivity indices of the new phases:

"Physicochemical Effects of the Action of an Explosion on a Substance"

Moscow, Izvestiya Akademii Nauk SSSR -- Neorganicheskiye Materialy,
Vol 6, No 4, Apr 70, pp 697-707

Abstract: The article gives a survey of the physicochemical transformations which occur in inorganic substances (of a nonmetallic character) under or as a result of dynamic loading. The thermodynamic peculiarities of the shock compression of single-crystal and polycrystalline materials are considered. It is shown that the passage of shock waves through a crystalline substance increases its hardness as a result of an increase in the dislocation density and misorientation of domains. A description is given of chemical transformations in shock waves, viz. the decomposition and formation of inorganic compounds. The present state-of-the-art is discussed with respect to phase transitions in the shock compression of inorganic materials. The physicochemistry of pulse pressures, though still in its initial stage of development, offers great opportunities for the study and transformation of matter. The author thanks G. B. BOKIYA for his assistance.

"Action of Explosion on Materials Crystallographic Study of Phase Transition in Boron Nitride"

Moscow, Zhurnal Strukturnov Khimii, Vol 11, No 1, 1970, pp 156-158

Abstract: A study was made of the actual structure of hexagonal BN preceding phase transition upon shock compression. A comparison was made of the molar volumes of hexagonal BN of differing densities with corresponding values of the true volume of the formula unit. A plot of volume of cell of hexagonal CN as a function of density showed that turbo-stratified BN has a very loosing packing. Its volume is 1.35 times greater than the true molecular volume. However, the small variation in the X-ray volume in the transition from almost amorphous to well crystallized state (only 5 percent) indicates that the main defects are parallel shifts of planes relative to each other. Results of shock compression of turbostratified BN ($d = 1.64-1.72$ grams/cm³) increased its density 2.04-2.07 grams/cm³. The authors thank R.S. ERENBURG and V.S. CHERKASSKIY for their assistance in the work.

"A Study of the Stability of Potassium Persulfate under Explosive Action"

Moscow, Khimiya Vysokikh Energiy, Vol 4, No 2, pp 154-159

Abstract: Infrared and EPR spectroscopy methods were used to study effects of explosive action on $K_2S_2O_8$, as compared to pyrolytic and radiation effects. It was determined that explosive and radiation action result in the formation of analogous paramagnetic centers, but that explosive and pyrolytic actions differ substantially in this respect. Tabular data are given on the following: (1) pH-metric titration of the persulfate following explosion; (2) infrared absorption spectra of various sulfate samples; (3) absorption spectra for both irradiated and irradiated-"exploded" persulfate; and (4) EPR spectra of the persulfate obtained under various conditions.

ABSTRACT/EXTRACT--(U) GP-0- ABSTRACT. THE YIELD OF THE DENSE FORM OF BN,

OBTAI... INCREASING DEGREE OF PERFECTION IN THE LATTICE OF HEXAGONAL BN
(BATSANOV, ET AL., 1968). THE STRUCTURE OF HEXAGONAL BN WAS STUDIED IN
MORE DETAIL TO EXPLAIN THE MECHANISM OF THE TRANSITION TO THE DENSE
FORM. THE PACKING OF HEXAGONAL BN IS VERY LOOSE BEFORE ANNEALING; THE
MAIN DEFECTS ARE PARALLEL SHIFTS OF THE BN PLANES RELATIVE TO EACH
OTHER. ANNEALING (1000-2000DEGREES) REMOVES THE DEFECTS BOTH WITHIN AND
BETWEEN THE LAYERS AND EVIDENCED BY THE SHARPENING OF THE 002 LINE AND
ITS SHIFT TOWARDS GREATER BRAGG ANGLES. ON THE OTHER HAND, EXPLOSIVE
COMPRESSION SHARPENS THE 002 LINE BUT DOES NOT SHIFT ITS POSITION,
SHOWING THAT ONLY DEFECTS WITHIN THE LAYERS ARE REMOVED. SUBSEQUENT
ANNEALING OF THE EXPLOSIVELY COMPRESSED SAMPLES SHIFTS THE 002 LINE TO
GREATER BRAGG ANGLES WITH SOME INCREASE IN THE LINE WIDTH. THE
MECHANISM OF THE TRANSITION, BN (COORDINATION NO. 3) YIELDS BN
(COORDINATION NO. 4), IS ANALOGOUS TO THE GRAPHITE YIELDS DIAMOND
TRANSITION. EXPLOSIVE COMPRESSION FOLDS THE HEXAGONAL BN LAYERS AND
FORCES THE ATOMS CLOSER TOGETHER, MAKING IT EASIER TO FORM THE NEW
BONDS. THE FORMATION OF THE SPHALERITE TYPE MODIFICATION OF BN IS
DISCUSSED. FACILITY: INST. TEPUFIZ., NOVOSIBIRSK, USSR.

241558 POLYFERRITE ELEMENTS having transversally differentiated properties are produced by charging layers of different ferrites powders into a mould, and then jointly compressing them and sintering. Optimum magnetic properties are attained in each layer by separately calcining each ferrite powder in an individual manner. In an example as $\text{MgO-MnO-Fe}_2\text{O}_3$ ferrite was fired at 900°C for 6 hrs, and an $\text{MnO-ZnO-Fe}_2\text{O}_3$ ferrite at 1000°C for 5 hrs; both were cooled in air, ground and treated with polyvinyl alcohol as a plasticiser. Layers of both powders were consecutively charged into a mould, compressed under a pressure of $220\text{-}250\text{ kg./cm.}^2$, and heated at a rate of 300°C/hr. to 1300°C , kept at this temperature for 6 hrs, and cooled to 1200°C over one hour; the cooling was completed at a pressure reduced to $1\text{-}3\text{ mm.}$

"Device For Deposition Of Multilayer Coverings In A Vacuum"

USSR Author's Certificate No 279291, filed 16 June 68, published 30 Nov 70 (from RZh--Radiotekhnika, No 9, Sep 1971, Abstract No 9V272F)

Translation: A device proposed for deposition of multilayer coverings in a vacuum is fulfilled in the form of a number of successively mounted independent operating chambers supplied with evaporators, heaters, and an exhaust system. The device contains a mechanism for transporting substrates, a mechanism for loading and unloading, and a drive mechanism. With the object of increasing the reliability of the device and improving the quality and reproducibility of the coverings deposited, outside of the area of the arrangement of operating chambers and parallel to it a supplementary vacuum chamber is installed, which serves for the deposition in it of the transporting mechanism, and which communicates with each of the operating chambers by means of vacuum-overlapping transfer windows located on the side wall

"Condition of Blood-Air Barrier Ultrastructure After Inhalation of Cupric Oxide Aerosols"

Moscow, Arkhiv Patologii, No 4, 1971, pp 54-61

Abstract: Electron microscope study of the reaction of rat pulmonary tissue to inhalation of cupric oxide aerosols showed both destructive and compensatory-adaptive processes. Within 15 min of inhalation, particles of the metal 30 to 3500 Å in size pass through the blood-air barrier (alveolar cells, basal layer, capillary endothelium) into the bloodstream. After making contact with the copper particles, the cytoplasmatic membrane becomes frayed and loses its electron-optical density. After the membrane is passed, it recovers, regaining its normal electron density and distinct contours. Chronic exposure to cupric oxide aerosols results in marked thickening of the basal layer, phagocytosis of the copper particles by macrophages of the alveolar septum and blood, and excretion of the aerosol through the bronchi. The pulmonary macrophages at this time contain a large number of phage

lysosomes with osmiophilic inclusions (lipids and ferritin). This shows that the ultrastructures of the cells are affected by mechanical as well as chemical factors. The result is gradual development of pulmonary fibrosis, cirrhosis of the alveolar septa, and emphysema.

"Thawed Erythrocytes as A New Charge for Artificial Circulation Equipment"

Moscow, Problemy Gematologii i Perelivaniya Krovi, Vol 15, No 7, Jul 70, pp 3-5

Abstract: Whole donor blood has been used in equipment for artificial circulation, but substantial difficulties are encountered when such blood must be ready for administration at a given moment. To study the overall perfusion of thawed and washed erythrocytes in open-heart surgery, 250 ml of thawed erythrocytes was introduced with small doses of whole blood. It was found that satisfactory blood levels could be maintained. The hemoglobin content in the peripheral blood was 8%, and the number of thrombocytes was reduced. The erythrocytes, which had been preserved for long periods of time, appeared to be resistant to all traumas during perfusion. No operative hemolysis was observed. Further study of this highly effective medium (erythrocytes diluted in a low-molecular-weight medium) is recommended.

"Myorelaxation of Animals by the Injection of 3,5-Dimethyl-4-bromopyrazole and
the Effect of Extracardial Nerve Stimulation Under These Conditions"

Moscow, Doklady Akademii Nauk SSSR, Vol 200, No 5, 1971, pp 1,252-1,253

Abstract: Intraperitoneal administration of 3,5-dimethyl-4-bromopyrazole in
a dose of 200-400 mg/kg to rabbits or in a dose of 300-500 mg/kg to dogs pro-
duced a state of profound myorelaxation, from which the animals recovered
within a time that increased with increasing doses of the drug. A dose of
450-500 mg/kg and > 500 mg/kg was lethal for rabbits and dogs, respectively.
Study of the effects of direct stimulation of the vagus or of sympathetic
nerves effecting adrenergic innervation of the heart, which was carried out in
experiments on dogs to which 350-500 mg/kg of the drug had been injected,
showed that the state of myorelaxation did not affect the action produced by
direct stimulation of the extracardial nerves.
